

Title: VIGMIS – Google Ads API Usage Documentation

1. Overview

VIGMIS is a SaaS platform designed to help businesses manage and optimize their Google Ads campaigns using automation and AI.

The system connects to users' Google Ads accounts with their explicit authorization and provides insights, recommendations, and automated actions to improve campaign performance.

2. How We Use Google Ads API

We use the Google Ads API strictly to:

- Read campaign performance data (metrics, keywords, ads, budgets)
- Analyze campaign efficiency using internal algorithms
- Suggest optimizations (bids, targeting, creatives)
- Optionally apply changes to campaigns based on user approval

We do not create accounts or run ads without user consent.

3. User Authorization

- Users authenticate via secure OAuth (Google login)
 - Users explicitly grant access to their Google Ads account
 - No data is accessed without user permission
-

4. Data Usage

We access only necessary data:

- Campaign performance metrics
- Ad groups, keywords, and ads
- Budget and bidding configurations

We do NOT:

- Sell user data
 - Share data with third parties
 - Use data outside the platform's optimization purposes
-

5. System Architecture

- Frontend: Web application (Next.js)
 - Backend: API server handling requests and Google Ads API calls
 - Database: Stores user settings and optimization history
 - Integration: Google Ads API for campaign data and actions
-

6. Security

- All data is transmitted over HTTPS
 - OAuth 2.0 is used for secure authentication
 - Access tokens are stored securely
 - Users can revoke access at any time
-

7. Access Scope

The platform is intended for:

- External users (businesses and clients)
 - Each user only accesses their own Google Ads account
-

8. Purpose

The purpose of using Google Ads API is to:

- Improve campaign performance
- Automate repetitive optimization tasks
- Provide better decision-making insights to advertisers
